Week 6

This week was mid-term week, I needed some time to prepare for the exam, so I just built a sign in and sign up page. I named this page reg.php.

Reg.php combines register and login function in one page. I want to simplify the number of pages I will create for this project, though it would make each page look a little complicated. Because I was too busy this week, I could just finish the outline of the page. In sign up section, we can clearly see the location for each input column and the name for the meaning of every input. Login section has two inputs and a button. The tab on the top of the container can switch the function between login and registration. All above are the content for reg.php.

Bootstrap is a great web development tools for web developers; however, for new users, it really needs to spend some time to familiarize with how to define class to each element and how to use the plugins in JavaScript. I have read some Bootstrap tutorials and understand how to configure Bootstrap to make it combine in HTML, but well-understanding does not mean I can write a page as easy as it looks like. Therefore, I still need a little time to familiarize the usage of Bootstrap. I believe I can better understand on how to build a page using Bootstrap in a couple of weeks.

I put more focus on preparing exam this week, so the efficiency for my design was a little slow. I will put much effort on complete building the rest pages and start designing columns for database, hopefully I can finish these things in the next few weeks.

This is entirely my own work, except as disclosed in the documentation. I gave help to the following persons:
