Week 3

My project for this semester is to design and build a website. This platform can let sellers post products which are no longer used, and buyers can buy those pre-owned items in a reasonable price. The tools used in this project are HTML, JavaScript, CSS, and MySQL as database. So far, I have just decided how this website will work, I need to start learning Bootstrap to actually build and adorn this platform.

Bootstrap is an open source front-end framework toolkit for developing with HTML, CSS, and JavaScript. Although this tool is aimed to help users build a web application or dynamic web page in an easier way, the usage of its framework is almost different from HTML framework I have learn before. To make the style of every page on my site look consistent, I have to really be familiar with Bootstrap. Therefore, I need to spend some time reading the documentation and try to figure out how to use each element to build the page.

To thoroughly read all the tutorial to understand what each element is doing and how they work, I estimate it would cost more than a week to accomplish. Therefore, I believe that there will be a lot of strong challenges for me to overcome.

This is entirely my own work, except as disclosed in the documentation. I gave help to the following persons:
